Definition. The overall displacement for a typical reciprocating piston engine is calculated by multiplying together three values; the distance travelled by the piston (the stroke length), the circular area of the cylinder (the bore), and the number of cylinders that comprise the whole engine. The formula is:  $\text{Displacement} = \text{stroke length} \times \pi \times (1/2 \times \text{bore})^2 \times \text{number of cylinders}$ .

### Engine displacement - Wikipedia

Engines are measured by displacement, usually expressed in liters (L) or cubic centimeters (cc). Displacement is the total volume of all the cylinders in an engine. An engine with four cylinders of 569cc each totals 2276cc, and will be rounded off and referred to as a 2.3 liter engine.
