One possible solution is to say that at least one of f_x, f_y is different than zero (these are partial derivatives) and so the set of singular points is the affine variety of A^2 given by $V(f, f_x, f_y)$. Since f is irreducible and assuming that $f_x \neq 0$, the sequence f, f_x is $k[x, y]$ -regular and so $\dim_k[x, y]/(f, f_x, f_y) = 0$.

(6)Algebraic curves were first studied over the complex numbers. Some peo-ple studied complex analysis of Riemann Surfaces, and others studied polynomials in two variables. Remark 2.1. We will use the language of smooth projective curves and compact Riemann surfaces interchangeably. We will assume all curves are over the complex numbers.
