Older used book (1940) appears to thoroughly cover plane and spherical trigonometry. I haven't been able to read through it as yet. There are many example problems in plane and spherical trigonometry including the celestial sphere. My book is used and old, but it is in very good condition.

PLANE AND SPHERICAL TRIGONOMETRY 3.1 Introduction It is assumed in this chapter that readers are familiar with the usual elementary formulas encountered in introductory trigonometry. We start the chapter with a brief review of the solution of a plane triangle. While most of this will be familiar to readers, it is suggested that it be not

1 Answer. Originally Answered: What is the difference between plane trigonometry and spherical trigonometric? In spherical trigonometry, triangles are made up of arcs which subtend angles at the centre of the sphere. The length of the side is therefore known in terms of the angles subtended at the centre. In addition, of course, there are the angles at each vertex, so a spherical triangle is specified by six angles.

For example, there is a spherical law of sines and a spherical law of cosines. As was described for a plane triangle, the known values involving a spherical triangle are substituted in the analogous spherical trigonometry formulas, such as the laws of sines and cosines, and the resulting equations are then solved for the unknown quantities.

Subject: Plane and Spherical Trigonometry

On the plane, the sum of the interior angles of any triangle is exactly 180°. On a sphere, however, the corresponding sum is always greater than 180° but also less than 540°. That is, 180° < $\alpha + \beta + \gamma$ < 540° in the diagram above. The positive quantity $E = \alpha + \beta + \gamma - 180^\circ$ is called the spherical excessof the triangle.
