Multislice spiral computed tomography MSCT is a newly emerging non-invasive modality for visualisation of the coronary tree. The high negative predictive values reported by most comparative studies with ICA indicate that MSCT may best be suited for the exclusion of CAD. 9, 11 However, studies have not evaluated this specific indication and no official guidelines for its clinical use exist.

Electron beam computed tomography and single slice and multislice spiral CT angiography (SCTA) have revolutionized the approach to the
assessment of patients with suspected PE. With spiral CT, imaging acquisition times and total scan times are dramatically reduced compared to conventional CT, and the pulmonary vascular tree can be investigated in a single breath-hold scan at peak contrast opacification.

Conventional multislice spiral tomography. The sheep heads were scanned with a Toshiba Aquilion 64-slice scanner ® (Toshiba Medical Systems, Otawara, Japan). After obtaining anterior–posterior and lateral scouts, the field of view (FOV) was decided at the table, as the sizes of the heads were different from each other, ranging from 24 to 32 cm.

5.2.2 Multislice Computed Tomography. Multislice CT (MSCT) is an advancement of single-slice CT (SSCT). The basic idea of MSCT is the use of multiple rows of detectors in conjunction with widening the X-ray beam in the z-direction (slice thickness) to use the X-ray beam more effectively.

ents with 73 joints of HA were consecutively selected from January 2016 to May 2018 for this prospective study. All 73 joints were examined by X-ray, CT, and MRI within 2 days. The MRI scores of the joints were determined by the International Prophylaxis Study Group (IPSG) standard. The CT findings were quantified according to the IPSG standard, except for cartilage injury, which was ...

[Value of multislice spiral computed tomography in finding coronary artery lesion in children with Kawasaki disease] Use of MSCT may help better find the lesions of coronary artery, especially those in middle and distant sections as compared to TDE. MSCT is better than TDE in exploring coronary wall calcification and coronary artery stenosis.
